                                                                                                                                                                                                                                                                                                                                                                                                 The present sequence represents a chimeric antisense oligonucleotide targeted to human microsomal prostaglandin E2 synthase (mpGES-1). The human mpGES-1 gene is located on chromosome 9, more specifically to 9q34.3. The present invention also describes: (1) antisense compounds, having a sequence comprising 8-30 bp targeted to a nucleic acid encoding mpGES-1, which specifically hybridise with the nucleic acid encoding inhibite its expression; (2) a method of inhibiting the expression of mpGES-1 in cells or tissues; and (3) a method of treating an animal having a disease or condition associated with mpGES-1. MpGES-1 chimeric antisense oligonucleotides and antisense compounds have cytostatic, antiinflammatory, neuroprotective, antiinflammatory, neuroprotective.

                                                             ADM14467 standard;
                                                                                                                                                                                                                                                                                        antiinflammatory, neuroprotective, nootropic, antiarthritic, vasotropic, ophthalmological, immunomodulatory and cardiovascular activities, and can be used as mPGES-1 inhibitors and in gene therapy. The antisense compound can be used for preparing a composition for treating a disease or condition associated with mPGES-1 e.g., inflammation, Alzheimer's disease, arthritis, diabetes, cancer, ischaemia or reperfusion injury, or ophthalmic, immunological, cardiovascular or neurological disorder.
                                                                                                                                                                                                                                                                   Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Claim 4; SEQ ID NO 433; 132pp; English.

The present sequence represents a chimeric antisense oligonucleotide CC targeted to human microsomal prostaglandin E2 synthase (mpGES-1). The CC human mpGES-1 gene is located no chromosome 9, more specifically to 934.3. The present invention also describes: (1) antisense compounds, CC having a sequence comprising 8-30 bp targeted to a nucleic acid encoding CC mpGES-1, which specifically hybridise with the nucleic acid encoding CC inhibits its expression; (2) a method of inhibiting the expression of CC mpGES-1 in cells or tissues; and (3) a method of treating an animal CC having a disease or condition associated with mpGES-1. MpGES-1 chimeric CC antisense oligonuclectides and antisense compounds have cytostatic, antidiabetic, immunomodulator, cardiant, neuroprotective, antidiabetic, immunomodulator, and cardiovascular activities, and can be used for preparing a composition for treating a disease or condition associated with mpGES-1 e.g., inflammation, Alzheimer's conditionation, immunological, cardiovascular or reperfusion injury, or ophthalmic, immunological, cardiovascular or neurological disorder.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         multiple myeloma; Hodgkin's disease; lymphoma; Gaucher's disease; Niemann-Pick disease; Letterer-Siwe disease; refractory erythroblastic anaemia; Di Guglielmo syndrome; congestive splenomegaly; Kala awar; sarcoidosis; primary splenic pancytopaenia; miliary tuberculosis; diseasemiated fungus disease; Fulminating septicaemia; malaria; vitamin B12 deficiency; folic acid deficiency; pyridoxine deficiency; vitamin B12 deficiency; folic acid deficiency; pyridoxine deficiency; vitamin B12 deficiency; folic acid deficiency; pyridoxine deficiency; vitamin B12 deficiency; folic acid deficiency; piebaldism; vitaligo; neurological damage; infertility; intestinal damage; irradiation; chemotherapy; AIDS; haematopoietic recovery; acute blood loss; neoplasm; cancer; ss; PCR; primer.
The invention relates to preparing a (vertebrate) human stem cell factor (SCF) polypeptide comprising growing host cells transformed or transfected with DNA encoding a human SCF that stimulates growth of haematopoietic progenitor cells under nutrient conditions, the DNA being operatively linked to an expression control sequence, and isolating the polypeptide produced. Also included is a recombinant host cell transformed or transfected with an expression construct comprising a vertebrate SCF polypeptide-encoding DNA operatively linked to a heterologous expression regulatory sequence, permitting the expression of the vertebrate SCF polypeptide in the host cell. Disclosed as new are rat and human nucleic acids encoding SCF, SCF proteins from a number of other
                                                                                                                                                                                                                                                         Preparing a human stem cell factor (SCF) polypeptide, useful for treating hematopoietic disorders, e.g., aplastic anemia, comprises growing host cells transformed or transfected with DNA encoding a human SCF.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              SCF; stem cell factor; gene therapy; haematopoietic progenitor cell; aplastic anaemia; paroxysmal nocturnal haemoglobinuria; myelofibrosis; myelosclerosis; osteopetrosis; metastatic carcinoma; acute leukaemia;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              CC transfected prokaryotic and eukaryotic host cells, and new and useful comethods for cultured growth of such host cells capable of expression of CC SCF and its related products. The DNA sequences are also useful as CC labelled probes in isolating human genomic DNA encoding SCF, in methods CC of protein synthesis, in genetic therapy in humans and other mammals, and CC in developing transgenic mammalian species which may serve as eukaryotic consts for production of SCF and SCF products in quantity. The SCF is consequenced in developing transferic mammalian species which may serve as eukaryotic constant of screaming haematopoietic disorders, e.g., aplastic anaemia, CC useful for treating haematopoietic disorders, e.g., aplastic anaemia, CC useful for treatatic carcinoma, acute leukaemia, multiple myeloma, CC steopetrosis, metastatic carcinoma, acute leukaemia, multiple myeloma, CC syndrome, congestive splenomegaly, Kala awar, sarcoidosis, primary CC syndrome, congestive splenomegaly, Kala awar, sarcoidosis, primary CC syndrome, congestive splenomegaly, Kala awar, sarcoidosis, primary CC syndrome, congestive splenomegaly, witamia, and folic acid deficiency, CT primary conditions and vitiligo. The SCF are also useful for creating neurological damage, infertility states, intestinal damage consistion or chemotherapy, and AIDS. SCF is also useful for centuring from irradiation or chemotherapy and AIDS. SCF is also useful concerned is a universal SCF por primary used in the isolation of SCF DNA concerns a SCF DNA in the infertility of SCF DNA in t

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    0
```

A method for the analysis of cDNA comprises (a) preparing an aggregate double-stranded cDNAs by using an aggregate of mRNAs and a plural type labelled reverse transcription primers (GENESEQ files AAQ75547-Q75798)

of of

Analysis of cDNA and gene expression - by amplification of mRNA followed by digestion with restriction enzymes.

                                                                                                                                                                                                                                                                                                                                                               A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type of labelled reverse transcription primers (GENESEQ files AAQ75547-Q75798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily

                                                                                                                                                                                                                                                                                                                                                                                                                                                                     A method for the analysis of cDNA comprises (a) preparing an aggregate double-stranded cDNAs by using an aggregate of mRNAs and a plural type labelled reverse transcription primers (GENESEQ files AAQ75547-Q75798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily

                                                                                                                                                                                                                                                                                               A method for the analysis of cDNA comprises (a) preparing an aggregate double-stranded cDNAs by using an aggregate of mRNAs and a plural type labelled reverse transcription primers (GENESEQ files AAQ75547-Q75798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily

A method for the analysis of cDNA comprises (a) preparing an aggregate double-stranded cDNAs by using an aggregate of mRNAs and a plural type labelled reverse transcription primers (GENESEQ files AAQ75547-Q75798) and using the aggregate of mRNAs as the template for each reverse
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type (labelled reverse transcription primers (GENESEQ files AAQ75547-Q75798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily

                                                                                                                                                                                                                                                                                                                                                                                                     A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type of labelled reverse transcription primers (GENESEQ files AAQ75547-Q75798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The electrophoresing the digested aggregate of cDNAs in seperate lanes.

                                                                                                                                                                                                                                                                        recombinant vaccinia virus comprising of a gag gene from a retrovirus such as HIV-1 or HIV-2, fused to a DNA fragment containing an epitope region (30-300 bases in length) of a retroviral gene other than the gag gene. The gag gene may be altered so as to produce a gag protein modified from the natural sequence by the addition, deletion or substitution of at least 1 amino acid residue. The fusion gene is inserted into a region of a vaccinia virus not essential to its propagation, to give a recombinant vaccinia virus vector which is used to transform a host cell (such as Hela, Vero, VEF, rabbit kidney RK13 or human myeloma TK-143 cells). Upon culturing the host cell produces particulate structures containing the fusion gag protein. The recombinant vaccinia virus or the fusion gag protein particles may be used in the production of vaccines for protecting against infection with retroviruses such as HIV

This invention describes a novel method for sorting single-stranded concleic acids by isolation and hybridisation of nucleic acid pools, then capture capture that are (a) immobilised on the surface of a solid matrix and (b) comprise variable and non-variable regions. The capture oligonucleotides comprise variable and non-variable regions. The capture oligonucleotides comprise variable and non-variable regions. The capture oligonucleotides comprises all possible combinations of up to 10 nucleotides to allow that comprises all possible combinations of up to 10 nucleotides to allow binding of particularly locked nucleic acids (LNA) and the anchor region capture oligonucleotides are biotinylated and immobilised on a surface by interaction with streptavidin. The matrix is of plastic, ceramic, glass, conducting properties and especially in the form of a chip. Its surface is particularly a layer of (bio)molecular filaments and binding of single stranded nucleic acids to the surface is (quasi) covalent, supramolecular, conducting properties and especially in the form of a chip. Its surface is physical, stimulated by an electrical field or through a molecular sieve. The method is used (1) for analysis of patterns, especially in mucosal, activity of pharmaceuticals and/or nutritional compounds, e.g. food acids (anino, carboxylic or fatty acid) or their derivatives, salts and captures. The method provides rapid, inexpensive and reproducible acid sols based on comparison of fatty acid) or their derivatives, salts and capture notes; small differences in the nucleic acid pools. Since the method is based on comparison of mucleic acid pools, not individual capturing enems.

This invention describes a novel method for sorting single-stranded nucleic acids by isolation and hybridisation of nucleic acid pools, then creading out, where the nucleic acids are selectively bound using capture agents that are (a) immobilised on the surface of a solid metrix and (b) comprise variable and non-variable regions. The capture oligonucleotides have a 5'-invariable anchor region, the complement of which is present at cleast once in each nucleic acid and a 3'-variable, discriminatory region that comprises all possible combinations of up to 10 nucleotides to allow binding of particulary locked nucleic acids (LMA) and the anchor region comprises a sequence of 10-50, particularly 15-25, T residues. The capture oligonucleotides are biotinylated and immobilised on a surface by interaction with streptavidin. The matrix is of plastic, ceramic, glass, conducting properties and especially in the form of a chip. Its surface is particularly a layer of (bio)molecular filaments and binding of single stranded nucleic acids to the surface is (quasi)covalent, supramolecular, by stranded nucleic acids to the surface is (quasi)covalent, supramolecular, by stranded nucleic acids to the surface is (quasi)covalent, supramolecular, by stranded nucleic acids to allow a electrical filed or through a molecular sieve. The method is used (i) for analysis of patterns, especially in mucosal, hair you blood, nerve or germ cells and (ii) for determining the activity of pharmaccuticals and/or nutritional compounds, e.g. food additives or supplements, especially minerals, trace elements, organic acids (amino, carboxylic or fatty acid) or their derivatives, salts and cardives or supplements, especially minerals, trace elements, organic acids (amino, carboxylic or fatty acid) or their derivatives, salts and cardives or supplements, especially minerals, trace elements, organic acids (amino, carboxylic or fatty acid) or their derivatives, salts and cardives or supplements, especially minerals, trace elements, organic acids elements, o

                                                      This invention describes a novel method for sorting single-stranded CC nucleic acids by isolation and hybridisation of nucleic acid pools, then CC reading out, where the nucleic acids are selectively bound using capture CC agents that are (a) immobilised on the surface of a solid matrix and (b) CC comprise variable and non-variable regions. The capture oligonuclectides CC have a 5'-invariable anchor region, the complement of which is present at CC least once in each nucleic acid and a 3'-variable, discriminatory region CC that comprises all possible combinations of up to 10 nucleotides to allow binding of particularly locked nucleic acids (LMA) and the anchor region CC comprises a sequence of 10-50, particularly 15-25, T residues. The capture CC agents are particularly locked nucleic acids (LMA) and the anchor region CC combined to the surface by interaction with streptavidin. The matrix is of plastic, ceramic, glass, CC metal, resin, gel, crystalline material and/or membrane, having semiconducting properties and especially in the form of a chip. Its surface is stranded nucleic acids to the surface is (quasi)covalent, supramolecular, CC physical, stimulated by an electrical field or through a molecular sieve. The method is used (i) for analysis of patterns, especially in mucosal, having the cacids (amino, carboxylic or fatty acid) or their derivatives, salts and conjunctives or supplements, especially minerals, trace elements, organic acids (amino, carboxylic or fatty acid) or their derivatives, salts and conjunctives or supplements, especially minerals, trace elements, organic mixtures. The method provides rapid, insxpensive and reproducible can detect very small differences in pools of nucleic acid from cells. It compounds is based on comparison of nucleic acid pools, not individual compounds is based on comparison of nucleic acid pools, not individual compounds is acid. The method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Example; Page 6; 8pp;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     and constant
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Sorting single-stranded nucleic acid, useful for analyzing expression patterns and screening active agents, uses capture agent with variable
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 28-FEB-2002; 2002DE-01008794
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       28-FEB-2002; 2002DE-01008794.

Sorting single-stranded nucleic acid, useful for analyzing expression patterns and screening active agents, uses capture agent with variable patterns and screenin and constant regions.

Example; Page 5; 8pp; German.

This invention describes a novel method for sorting single-stranded CC nucleic acids by isolation and hybridisation of nucleic acid pools, then CC agents that are (a) immobilised on the surface of a solid matrix and (b) CC comprise variable and non-variable regions. The capture oligonucleotides CC least once in each nucleic acid and a 3'-variable, discriminatory region that comprises all possible combinations of up to 10 nucleotides to allow that comprises all possible combinations of up to 10 nucleotides to allow CC binding of particular sorts of single stranded nucleic acids. The capture capture oligonucleotides to allow comprises a sequence of 10-50, particularly 15-25. T residues. The capture capture oligonucleotides are biotinylated and immobilised on a surface by interaction with streptavidin. The matrix is of plastic, ceramic, glass, conducting properties and especially in the form of a chip. Its surface is particularly a layer of (bio)molecular filaments and binding of single stranded nucleic acids to the surface is (quasi) covalent, supramolecular, conducting properties and especially in the form of a chip. Its surface is particularly a layer of (bio)molecular filaments and binding of single stranded nucleic acids to the surface is (quasi) covalent, supramolecular, conducting properties and especially in the form of a chip. Its surface capture of pharmaceuticals and/or nutritional compounds, e.g. food additives or supplements, especially minerals, trace elements, organic cativity of pharmaceuticals and/or nutritional compounds, e.g. food acids (amino, carboxylic or fatty acid) or their derivatives, salts and captures in acids from cells. It can detect very small differences in pools of nucleic acid pools, since the method is based on comparison of nucleic acid pools, not individual can be should capture probes used in the method of the invention.

Sorting single-stranded nucleic acid, useful for analyzing expression patterns and screening active agents, uses capture agent with variable and constant regions.

Example; Page 5; 8pp; German.

This invention describes a novel method for sorting single-stranded councleic acids by isolation and hybridisation of nucleic acid pools, then concleic acids by isolation and hybridisation of nucleic acid pools, then capture acid pools, then capture that are (a) immobilised on the surface of a solid matrix and (b) comprise variable and non-variable regions. The capture oligonucleotides have a 5'-invariable anchor region, the complement of which is present at least once in each nucleic acid and a 3'-variable, discriminatory region that comprises all possible combinations of up to 10 nucleotides to allow binding of particular sorts of single stranded nucleic acids. The capture capture oligonucleotides are biotinylated and immobilised on a surface by interaction with streptavidin. The matrix is of plastic, ceramic, glass, conducting properties and especially in the form of a chip. Its surface is particularly a layer of (bio)molecular filaments and binding of single stranded nucleic acids to the surface is (quasi) covalent, supramolecular, physical, stimulated by an electrical field or through a molecular steve. The method is used (i) for analysis of patterns, especially in mucosal, aciditives or supplements, especially minerals, trace elements, organic aciditives or supplements, especially minerals, trace elements, organic aciditives, insign of the complete said) or their derivatives, salts and creproducible single fine the complete pattern of all nucleic acids from cells. It can detect very small differences in pools of nucleic acid pool. Since the method is based on comparison of nucleic acid pool, since the method is based on comparison of nucleic acid pool, not individual genes, matrix miniaturisation is possible.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       SXS
CC This invention describes a novel method for sorting single-stranded CC nucleic acids by isolation and hybridisation of nucleic acid gools, then CC reading out, where the nucleic acids are selectively bound using capture CC agents that are (a) immobilised on the surface of a solid matrix and (b) CC comprise variable and non-variable regions. The capture oligonucleotides have a 5'-invariable anchor region, the complement of which is present at CC least once in each nucleic acid and a 3'-variable, discriminatory region CC binding of particularly locked nucleic acids under anchor region that comprises a sequence of 10-50, particularly 15-25, T residues. The capture oligonucleotides are biotinylated and immobilised on a surface by interaction with streptavidin. The matrix is of plastic, ceramic, glass, CC metal, resin, gel, crystalline material and/or membrane, having semi-conducting properties and especially in the form of a chip. Its surface is particularly a layer of (bio)molecular filaments and binding of single stranded nucleic acids to the surface is (quasi) covalent, supramolecular, physical, stimulated by an electrical field or through a molecular sieve. The method is used (i) for analysis of patterns, especially in mucosal, having cathovylic or fatty acid) or their derivatives, salts and CC acids (amino, carboxylic or fatty acid) or their derivatives, salts and CC mixtures. The method provides rapid, inexpensive and reproducible of continues. The method provides rapid, inexpensive and reproducible. It

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         밁
       connucleic acids by isolation and hybridisation of nucleic acid pools, then corrections out, where the nucleic acids are selectively bound using capture agents that are (a) immobilised on the surface of a solid matrix and (b) comprise variable and non-variable regions. The capture oligonucleotides have a 5'-invariable anchor region, the complement of which is present at clear once in each nucleic acid and a 3'-variable, discriminatory region that comprises all possible combinations of up to 10 nucleotides to allow that comprises all possible combinations of up to 10 nucleotides to allow combining of particular sorts of single stranded nucleic acids. The capture agents are particularly 10-00, particularly 15-25, Tresidues. The capture comprises a sequence of 10-50, particularly 15-25, Tresidues. The capture oligonucleotides are biotinylated and immobilised on a surface by interaction with streptavidin. The matrix is of plastic, ceramic, glass, certain, resin, gel, crystalline material and/or membrane, having semiconducting properties and especially in the form of a chip. Its surface is particularly a layer of (bio)molecular filaments and binding of single stranded nucleic acids to the surface is (quasi)covalent, supramolecular, physical, strimulated by an electrical field or through a molecular sieve. The method is used (i) for analysis of patterns, especially in mucosal, activity of nbarracenticals and/or nutritional formounds as a food
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Query Match

e.g.

additives or supplements, especially minerals, trace elements, organic acids (amino, carboxylic or fatty acid) or their derivatives, salts and mixtures. The method provides rapid, inexpensive and reproducible representation of differences in pools of nucleic acids from cells. It allows imaging of the complete pattern of all nucleic acid in a cell, a can detect very small differences in the nucleic acid pool. Since the method is based on comparison of nucleic acid pools, not individual genes, matrix miniaturisation is possible. ADK01281-ADK01344 represent capture probes used in the method of the invention. and

Example; Page 5; 8pp; German.

This invention describes a novel method for sorting single-stranded CC nucleic acids by isolation and hybridisation of nucleic acid pools, then compared the problem of a selectively bound using capture in mobilised on the surface of a solid matrix and (b) CC comprise variable and non-variable regions. The capture oligonuclectides have a 5'-invariable anchor region, the complement of which is present at least once in each nucleic acid and a 3'-variable, discriminatory region that comprises all possible combinations of up to 10 nucleotides to allow binding of particular sorts of single stranded nucleic acids. The capture agents are particularly locked nucleic acids (LNA) and the anchor region CC comprises a sequence of 10-50, particularly 15-25, T residues. The CC capture oligonucleotides are bictinylated and immobilised on a surface by interaction with streptavidin. The matrix is of plastic, ceramic, glass, conducting properties and especially in the form of a chip. Its surface is particularly a layer of (bio)molecular filaments and binding of single surface is remarked murlair acids to the surface is particularly a layer of (bio)molecular filaments and binding of single to the surface is (quasi)covalent,

> Query Match Best Local S Matches 19 physical, stimulated by an electrical field or through a molecular sieve The method is used (i) for analysis of patterns, especially in mucosal, hair root, blood, nerve or germ cells and (ii) for determining the activity of pharmaceuticals and/or nutritional compounds, e.g. food additives or supplements, especially minerals, trace elements, organic acids (amino, carboxylic or fatty acid) or their derivatives, salts and mixtures. The method provides rapid, inexpensive and reproducible representation of differences in pools of nucleic acids from cells. It allows imaging of the complete pattern of all nucleic acid in a cell, an method is based on comparison of nucleic acid pools. Since the method is based on comparison of nucleic acid pools, not individual genes, matrix miniaturisation is possible. ADK01281-ADK01344 represent capture probes used in the method of the invention. Sequence 21 Similarity BP; 0 Conservative A; 0 100.0%; 0.7%; C; 2 0 Ģ. Score 19; Pred. cc conducting properties and especially in the form of a chip. Its surface
cs is particularly a layer of (bio)molecular filaments and binding of single
cc stranded nucleic acids to the surface is (quasi)covalent, supramolecular,
cc physical, stimulated by an electrical field or through a molecular sieve.
cc The method is used (i) for analysis of patterns, especially in mucosal,
cc hair root, blood, nerve or germ cells and (ii) for determining the
cc activity of pharmaceuticals and/or nutritional compounds, e.g. food
cc additives or supplements, especially minerals, trace elements, organic
cc acids (amino, carboxylic or fatty acid) or their derivatives, salts and
cc mixtures. The method provides rapid, inexpensive and reproducible
cc representation of differences in pools of nucleic acids from cells. It
cc allows imaging of the complete pattern of all nucleic acid in a cell, and
cc can detect very small differences in the nucleic acid mool. Since the
cc method is based on comparison of nucleic acid pools, not individual
cc capture probes used in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         RESULT
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           CC agents are particularly locked nucleic acids (LNA) and the anchor region CC comprises a sequence of 10-50, particularly 15-25. T residues. The CC capture oligonucleotides are biotinnylated and immobilised on a surface by CC interaction with streptavidin. The matrix is of plastic, ceramic, glass, CC metal, resin, gel, crystalline material and/or membrane, having semi-CC conducting properties and especially in the form of a chip. Its surface is particularly a layer of (bio)molecular filaments and binding of single CC stranded nucleic acids to the surface is (quasi) covalent, supramolecular, physical, stimulated by an electrical field or through a molecular sieve. CC The method is used (i) for analysis of patterns, especially in mucosal, CC hair root, blood, nerve or germ cells and (ii) for determining the CC activity of pharmaceuticals and/or nutritional compounds, e.g. food CC additives or supplements, especially minerals, trace elements, organic CC mixtures. The method provides rapid, inexpensive and reproducible CC representation of differences in pools of nucleic acids from cells. It CC allows inaging of the complete pattern of all nucleic acid made cell, and CC anish based on comparison of nucleic acid pool. Since the complete pattern of all nucleic acid pool. Since the matrix miniaturisation is possible. ADX01281-ADX01344 represent comparison of the complete pattern of the nucleic acid pool.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        CC have a 5'-invariable anchor region, the complement of which is present at CC least once in each nucleic acid and a 3'-variable, discriminatory region CC bhiding of particular sorts of single stranded nucleic acids. The capture CC capture oligonucleotides of 10-50, particularly 15-25, T residues. The capture CC capture oligonucleotides are biotinylated and immobilised on a surface by CC capture oligonucleotides are biotinylated and immobilised on a surface by CC capture oligonucleotides are biotinylated and immobilised on a surface by CC capture oligonucleotides are biotinylated and immobilised on a surface by CC capture oligonucleotides are biotinylated and immobilised on a surface by CC capture oligonucleotides are biotinylated and immobilised on a surface by CC capture oligonucleotides are biotinylated and immobilised on a surface by CC capture oligonucleotides are biotinylated and immobilised on a surface by CC capture oligonucleotides are biotinylated and immobilised on a surface by conducting properties and sepecially in the form of a chip. Its surface conducting properties and sepecially in the form of a chip. Its surface conducting properties and sepecially in the form of a supramolecular, or through a molecular sieve. The method is used (i) for analysis of patterns, especially in mucosal, activity of pharmaceuticals and/or nutritional compounds, e.g. food captures or supplements, especially minerals, trace elements, organic captures. The method provides rapid, inexpensive and reproducible captures in a capture probes used in the mucleic acids from calls. It captures the method of the comparison of nucleic acids from calls. It captures are supplements of supplements of all mucleic acids in a cell, and capture probes used in the method of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         CC have a 5'-invariable anchor region, the complement of which is present at CC least once in each nucleic acid and a 3'-variable, discriminatory region CC that comprises all possible combinations of up to 10 nucleotides to allow GC sinding of particular sorts of single stranded nucleic acids. The capture CC capture oligonucleotides are biotinnylated and immobilised on a surface by CC capture oligonucleotides are biotinnylated and immobilised on a surface by CC metal, resin, gel, crystalline material and/or membrane, having semiconducting properties and especially in the form of a chip. Its surface is particularly a layer of (bio)molecular filaments and binding of single stranded nucleic acids to the surface is (quasi) covalent, supramolecular, CC metal, resimilated by an electrical field or through a molecular, CC metal, stimulated by an electrical field or through a molecular, CC mixtures. The method is used (i) for analysis of patterns, especially in mucosal, hair root, blood, nerve or germ cells and (ii) for determining the captures. The method provides rapid, inexpensive and reproducible cacids (amino, carboxylic or fatty acid) or their derivatives, salts and captures. The method provides rapid, inexpensive and reproducible callows imaging of the complete pattern of all nucleic acids from cells. It callows imaging of the complete pattern of all nucleic acid from cells. It callows imaging of the complete pattern of all nucleic acid from cells. It callows imaging of the complete pattern of all nucleic acid from cells. It callows imaging the complete pattern of all nucleic acid from cells. It callows imaging on comparison of nucleic acids from cells. It callows imaging the comparison of nucleic acids from cells. It callows imaging the comparison of nucleic acids from cells. It callows imaging the comparison of nucleic acid scid from cells. It callows imaging the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ş
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               CC that comprises all possible combinations of up to 10 nucleotides to allow the agents are particular sorts of single stranded nucleic acids. The capture CC agents are particularly locked nucleic acids (LNA) and the anchor region CC comprises a sequence of 10-50, particularly 15-25, T residues. The CC capture oligonucleotides are biotinylated and immobilised on a surface by CC interaction with streptavidin. The matrix is of plastic, ceramic, glass, CC metal, resin, gel, crystalline material and/or membrane, having semi-cc conducting properties and especially in the form of a chip. Its surface stranded nucleic acids to the surface is (quasi)covalent, supramolecular, CC physical, stimulated by an electrical field or through a molecular sieve. CC The method is used (i) for analysis of patterns, especially in mucosal, CC matrix of pharmaceuticals and/or nutritional compounds, e.g. food CC additives or supplements, especially minerals, trace elements, organic caids (amino, carboxylic or fatty acid) or their derivatives, salts and CC acids (amino, carboxylic or fatty acid) or their derivatives, salts and CC acids (amino, carboxylic or fatty acid) or their derivatives, salts and CC acids (amino, carboxylic or fatty acid) or their derivatives, salts and CC acids (amino, carboxylic or fatty acid) or their derivatives, salts and CC acids (amino, carboxylic or fatty acid) or their derivatives, salts and CC acids (amino, carboxylic or fatty acid) or their derivatives, salts and callows imaging of the complete spid, inexpensive and reproducible callows imaging of the complete pattern of all nucleic acid from cells. It CC allows imaging on comparison of nucleic acid pool. Since the CC andetect very small differences in the nucleic acid pool. Since the CC andetect very small differences in the nucleic acid pool. Since the CC andetect very small and the marked of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   This invention describes a novel method for sorting single-stranded nucleic acids by isolation and hybridisation of nucleic acid pools, then reading out, where the nucleic acids are selectively bound using capture agents that are (a) immobilised on the surface of a solid matrix and (b) comprise variable and non-variable regions. The capture oligonucleotides have a 5'-invariable anchor region, the complement of which is present at least once in each nucleic acid and a 3'-variable, discriminatory region.
                                                                                                                                                                                                                          04-SEP-2003

                                                                            Comprise variable and non-variable regions. The capture oligonuclectides to comprise variable anchor region, the complement of which is present at CC least once in each nucleic acid and a 3'-variable, discriminatory region that comprises all possible combinations of up to 10 nucleotides to allow cCC binding of particular sorts of single stranded nucleic acids. The capture agents are particularly locked nucleic acids (LNA) and the anchor region CC comprises a sequence of 10-50, particularly 15-25, T residues. The CC capture oligonucleotides are biotinylated and immobilised on a surface by conducting properties and especially in the form of a chip. Its surface is particularly a layer of (bio)molecular filaments and binding of single stranded nucleic acids to the surface is (quasi)covalent, supramolecular, CC physical, stimulated by an electrical field or through a molecular sieve. The method is used (i) for analysis of patterns, especially in mucosal, cardistives or supplements, especially minerals, trace elements, organic acids (amino, carboxylic or fatty acid) or their derivatives, salts and CC acids (amino, carboxylic or fatty acid) or their derivatives, salts and CC acids (amino, carboxylic or fatty acid) or their derivatives, salts and CC acids (amino, carboxylic or fatty acid) or their derivatives, salts and CC acids (amino, carboxylic or fatty acid) or their derivatives, salts and CC acids (amino, carboxylic or fatty acid) or their derivatives, salts and CC acids (amino, carboxylic or fatty acid) or their derivatives, salts and CC acids (amino, carboxylic or fatty acid) or their derivatives, salts and carboxylic or fatty acid) or their derivatives, salts and carboxylic or fatty acid) or their derivatives, salts and carboxylic or fatty acid) or their derivatives, the coll, and cell, and cell, and cell, and cell, and cell acids of the comparison of nucleic acid pool. Since the cells and only on the method of the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This invention describes a novel method for sorting single-stranded the nucleic acids by isolation and hybridisation of nucleic acid pools, then reading out, where the nucleic acids are selectively bound using capture agents that are (a) immobilised on the surface of a solid matrix and (b)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sorting single-stranded nucleic acid, useful for analyzing expression patterns and screening active agents, uses capture agent with variable
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       and constant
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       regions

```
CC This invention describes a novel method for sorting single-stranded CC nucleic acids by isolation and hybridisation of nucleic acid pools, then creating out, where the nucleic acids are selectively bound using capture CC agents that are (a) immobilised on the surface of a solid matrix and (b) CC comprise variable and non-variable regions. The capture oligonucleotides CC have a 5'-invariable and non-variable region, the complement of which is present at cleast once in each nucleic acid and a 3'-variable, discriminatory region CC that comprises all possible combinations of up to 10 nucleotides to allow Sinding of particularly locked nucleic acids (LNA) and the anchor region CC comprises as sequence of 10-50, particularly 15-25, T residues. The capture oligonucleotides are biotinylated and immobilised on a surface by CC capture oligonucleotides are biotinylated and immobilised on a surface by CC capture oligonucleotides are biotinylated and immobilised on a surface by CC capture oligonucleotides are biotinylated and immobilised on a surface by CC capture oligonucleotides and especially in the form of a chip. Its surface is particularly a layer of (bio)molecular filaments and binding of single CC physical, stimulated by an electrical field or through a molecular; of the method is used (i) for analysis of patterns, especially in mucosal, acids (maino, carboxylic or fatty acid) or their derivatives, salts and representation of differences in pools of nucleic acid from cells. It can detect very small differences in pools of nucleic acid from cells. It can detect very small differences in the nucleic acid pool. Since the genes, matrix miniaturisation is possible. This invention describes a novel method for sorting single-stranded CC nucleic acids by isolation and hybridisation of nucleic acid pools, then computed acids out, where the nucleic acids are selectively bound using capture agents that are (a) immobilised on the surface of a solid matrix and (b) CC comprise variable and non-variable regions. The capture oligonucleotides CC have a 5'-invariable and non-variable region. The complement of which is present at least once in each nucleic acid and a 3'-variable, discriminatory region CC that comprises all possible combinations of up to 10 nucleotides to allow binding of particular sorts of single stranded nucleic acids. The capture agents are particularly locked nucleic acids (LNA) and the anchor region comprises a sequence of 10-50, particularly 15-25, T residues. The capture oligonucleotides are biotinylated and immobilised on a surface by interaction with streptavidin. The matrix is of plastic, ceramic, glass, conducting properties and especially in the form of a chip. Its surface is particularly a layer of (bo) molecular filaments and binding of single stranded nucleic acids to the surface is (quasi) covalent, supramolecular, the method is used (i) for analysis of patterns, especially in mucosal, cardistives or supplements, especially minerals, trace elements, organic acids (amino, carboxylic or fatty acid) or their derivatives, salts and cardis (amino, carboxylic or fatty acid) or their derivatives, salts and cardis (amino, carboxylic or fatty acid) or their derivatives, salts and cardis (amino, carboxylic or fatty acid) or their derivatives, salts and cardis (amino, carboxylic or fatty acid) or their derivatives, salts and cardis (amino, carboxylic or fatty acid) or their derivatives, salts and cardis (amino, carboxylic or fatty acid) or their derivatives, salts and cardis (amino, carboxylic or fatty acid) or their derivatives, salts and cardis or mucleic acid pool. Since the capture probes used in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Sorting single-stranded nucleic acid, useful for analyzing expression patterns and screening active agents, uses capture agent with variable
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Example; Page 5; 8pp; German.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention describes a method for the comparative detection of the amount of an RNA. The method comprises: (a) cDNAs obtained by CC transcribing respectively from at least two tissue RNAs are respectively from at least two tissue RNAs are respectively CC fragmented by using a same restriction enzyme; (b) each different adaptor and a common adaptor are added to each of the cDNA fragments derived from CC the same or different tissues by the step (a); (c) the resultant adaptor-added cDNAs are mixed together; (d) an adaptor primer having the common cc equence to said different adaptor and a gene-specific adaptor are used cc amplify said adaptor-added cDNAs containing no region derived from CC polyadenylic acid of the mRNA before the addition of the adaptor among the common sequence to each of the measured between the tissues; (f) the RNA is detected CC contained to each of the genomic DNA fragments derived from a same or cc different individuals; (h) the resultant adaptor added genomic DNAs are adaptor adaptor and a common adaptor continuous tree measured between the tissues; (f) the RNA is detected CC are added to each of the genomic DNA fragments derived from a same or cc different individuals; (h) the resultant adaptor-added genomic DNAs are amplified by using can adaptor primer having the common sequence to the different adaptor and cof the genomic DNAs are amplified by using the detection of the amounts of RNA and DNA. The present common commo

They are used in a method for detecting an antigen in a subject. The method involves binding the antigen to a solid support and then reacting it with an immunoreactive ligand (L) bound to an oligo; removing any unreacted L, and then detecting the presence of the oligo. A similar method can be used to detect has, in which case the ligand is an oligo-labelled Ag. The use of an amplifiable oligo as the label allows Ag or At to be detected at very low levels. An exemplary oligi is AAQ75024 which can be covalently attached by the 5'- terminus to the N- or C-terminal of a synthetic peptide. For LCR using oligo AAZ75024, oligos 1-4 (see AAQ75027-Q75030) can be used. (Updated on 25-MAR-2003 to correct PN

RESULT 75 AAZ00877/c Ş 밁 SSSSSSSSSSS Query Match Best Local S Matches 19 PG1 gene; biallelic marker; PCR primer; PG1-related biallelic marker; cancer; prostate cancer; diagnosis; therapy; prostate specific antigen; PSA; human; ss. unreacted L, and then detecting the presence of the oligo. A similar method can be used to detect Abs, in which case the ligand is an oligo-labelled Ag. The use of an amplifiable oligo as the label allows Ag or Ab to be detected at very low levels. An examplary oligi is AAQ75024 which can be covalently attached by the 5'- terminus to the N- or C-terminal of a synthetic peptide. For LCR using oligo AAZ75024, oligos 1-4 (see AAQ75027-Q75030) can be used. Use of a prostate cancer associated gene and biallelic markers derived from it.

Example 6; Page 42; 385pp; English.

The invention relates to a mammalian PG1 gene and protein, and a set of CC PG1 biallelic markers. The PG1 polynucleotide and biallelic markers are CC used in a hybridisation assay, a sequencing assay, or in an allele-cC specific amplification assay for determining the identity of a nucleotide CC at a PG1-related biallelic marker. The methods can be used to detect and CC diagnosis of prostate cancer relies on prostate specific antigen (PSA) CC diagnosis of prostate cancer relies on prostate specific antigen (PSA) CC disage. However, the effectiveness of this is limited due to its CC of the organ. A need exists for both a reliable diagnostic procedure CC which would enable early-stage diagnosis, and for preventative and CC curative treatments of the disease. The PG1 gene can be used for CC detection of prostate cancer, and the risk of developing it in the CC future, and can also be used to determine therapies for the disease

                                                                                                                                                                                                                                    Homo sapiens (human)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Similarity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Conservative
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            was blunt end-repaired with T4 DNA polymerase and T4 polymucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pWB42 (gi|4732114|gb|AF129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent B. coli XL10-Gold (Stratagene) cells and selected for ampicillin resistance."

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 (http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polynucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pDM12 (gi|4732114|gb|AF129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli XL10-Gold (Stratagene) cells and selected for ampicillin resistance."

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Similarity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     (bases 1 to 30)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Conservative
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          (http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polynucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pWH2 (gi|4732114|gb|AF129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli XL10-Gold (Stratagene) cells and selected for ampicillin resistance."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   USA
